

Kislay Naturals

• Prepared by Dr. Surbhi · Alippo AI Co-Founder

Spelling & content review · URL/slug review · On-page SEO · Metadata · Self-check tools & links

Executive Summary

kislaynaturals.com is a Next.js D2C store for monk fruit sweeteners with a genuinely strong blog program (17+ articles) and clean product presentation. The biggest issue is **on-page SEO metadata is not unique per page** — the homepage, product pages, About, Contact, and legal pages all share the exact same `<title>` and meta description. There's also a recurring **URL slug problem** on 3 older blog posts, a **brand-name/legal-detail inconsistency** in the footer between pages, and a **title vs. H1 mismatch** on at least one blog post. None of these are hard to fix — most are a few hours of work in the CMS.

Overall assessment: **Needs work** — strong content foundation, weak technical/on-page SEO hygiene.

1. Duplicate Meta Titles & Descriptions (Critical)

Every page checked — homepage, the Monk Fruit Drops product page, About Us, and Contact Us — returns the **identical** title tag and meta description:

ELEMENT	VALUE FOUND ON ALL PAGES
Title	"Kislay Naturals – Monk Fruit Sweeteners"
Meta description	"Kislay Naturals offers pure monk fruit-based sweeteners for a healthy, sustainable lifestyle."

Why it matters: Google treats duplicate titles/descriptions as a signal the pages are interchangeable, so it will pick only one to show in search and may suppress the rest. The product page — which should be ranking for "monk fruit sweetener drops" — has no product-specific title at all.

Fix: Write a unique title + description for every template (home, PDP, About, Contact, policy pages). Keep titles 50–60 characters and descriptions 150–160 characters.

Check it yourself:

- Open each URL below and view page source (`Ctrl+U` / `Cmd+Option+U`), search for `<title>` — [Homepage](#) · [Product page](#) · [About](#) · [Contact](#)

- Or run a free crawl in **Screaming Frog SEO Spider** (free up to 500 URLs) → <https://www.screamingfrog.co.uk/seo-spider/> — install, paste the domain, hit Start, then check the "Page Titles" and "Meta Description" tabs for the "Duplicate" filter.
- Or Google Search Console → **Pages** report, sitting under Indexing, will show "Duplicate, Google chose different canonical" if this is already hurting indexing → <https://search.google.com/search-console>

2. Non-Descriptive Blog URL Slugs

Most blog slugs are good (e.g. [/blog/quit-sugar-naturally-monk-fruit](#)), but three older posts use non-descriptive, keyword-empty slugs:

PAGE TITLE	CURRENT URL	SUGGESTED SLUG
"Is Monk Fruit Sweetener Good for Diabetics?"	/blog/monk-fruit-2	/blog/monk-fruit-sweetener-good-for-diabetics
"5 Reasons to Switch from Sugar to Monk Fruit Sweetener Today"	/blog/monk-fruit-3	/blog/5-reasons-switch-sugar-to-monk-fruit
"Why Monk Fruit Sweetener is the Best Natural Sugar Substitute in India"	/blog/monk-fruit-1	/blog/best-natural-sugar-substitute-in-india

Why it matters: URL slugs are a (small but real) ranking signal, and a descriptive slug earns more clicks in search results. "monk-fruit-2" tells a searcher nothing about the article.

Fix: Rename the slugs to match the article topic, and **301-redirect** the old URLs to the new ones so you don't lose any existing rankings/backlinks.

Check it yourself:

- Browse <https://www.kislaynaturals.com/blog> and scan every post URL for generic numbering.
- Free slug/URL audit: **Ahrefs Webmaster Tools** (free for verified site owners) → <https://ahrefs.com/webmaster-tools> → Site Audit → "URL" issues.
- If you rename a slug, verify the redirect works with a free checker: <https://httpstatus.io/> (paste old URL, confirm it 301s to the new one, not a 404).

3. Brand Name / Legal Footer Inconsistency

The footer copyright line is different depending on which page you land on:

PAGE	FOOTER TEXT
Homepage	"© 2026 Kislay Naturals Private Limited (GSTNO:-24AAMCK8534G1ZB). All rights reserved."
Blog posts (e.g. quit-sugar-naturally-monk-fruit)	"© 2026 Kislay . All rights reserved."

Why it matters: This looks small, but for a food/health brand it's a trust signal — inconsistent legal entity naming across pages can raise questions during a Meta/Google ads compliance review, and it looks unpolished to a first-time visitor who lands on a blog post from search or social.

Fix: Make the footer component consistent — full legal name + GST number — across every template.

Check it yourself: Scroll to the bottom of the [homepage](#) vs. any [blog post](#) and compare the last line.

4. Title Tag vs. On-Page H1 Mismatch

On the blog post at </blog/quit-sugar-naturally-monk-fruit> :

- **Title tag / OG title:** "How to Quit Sugar Naturally **with Monk Fruit Sweetener**"
- **Actual H1 on the page:** "How to Quit Sugar Naturally **Without Feeling Deprived**"

Why it matters: Google generally trusts the H1 more than the title tag for topical relevance. When they don't match, it can confuse which query the page should rank for, and it's a jarring experience for a reader who clicked a search result with one headline and lands on a page with another.

Fix: Align the title tag and H1 to say the same thing (they can be worded slightly differently, but should carry the same core promise).

Check it yourself: Open the [article](#), compare the browser tab text to the big heading on the page. Repeat this spot-check on your other 16 blog posts — it's a 2-minute-per-post check.

5. Twitter Card Not Article-Specific

Blog posts set a proper Open Graph article title, but the **Twitter card** title/description still shows the generic homepage copy ("Kislay Naturals – Monk Fruit Sweeteners" / the generic tagline) instead of the article's own title, on every blog post checked.

Why it matters: If someone shares a blog link on X/Twitter, the preview card won't show the article title — just the generic brand tagline, which hurts click-through from social shares.

Fix: Set `twitter:title` and `twitter:description` per-page, same as you already do for `og:title` / `og:description` .

Check it yourself: Paste any blog URL into **Twitter/X Card Validator alternative** —

<https://cards-dev.twitter.com/validator> is deprecated, so use <https://www.opengraph.xyz/> (paste the URL, it shows exactly what Twitter/LinkedIn/Facebook previews will render).

6. Pages Render Empty in Raw HTML (JS-dependent content)

Fetching the raw HTML of **About**, **Contact Us**, and both blog listing pages returns only the `<head>` metadata — the actual visible content loads in afterward via JavaScript.

Why it matters: Modern Google generally renders JavaScript fine, but it's a second-pass process and not guaranteed for every crawler (Bing, some AI answer engines, and link-preview bots often don't render JS at all). This is worth confirming isn't costing you indexation on these pages specifically.

Check it yourself:

- Google's own renderer: **URL Inspection tool** in Search Console → <https://search.google.com/search-console> → paste the About/Contact URL → "Test Live URL" → View Tested Page → Screenshot tab. If the screenshot shows full content, Google is rendering it fine.
 - Quick manual check: right-click any page → "View Page Source" (not "Inspect") — if the body is empty/near-empty like it was for us, that confirms it's client-rendered.
-

7. Spelling & Grammar — Spot Check

No outright typos surfaced in the pages we pulled (homepage, 2 product pages, About, Contact, 2 blog posts), but we only sampled roughly a third of the site's ~30 pages — the full blog archive (17 posts) and 6 recipe pages weren't individually proofread here.

Do this yourself (fastest way to cover 100% of the site in one pass):

1. Install the **LanguageTool** browser extension (free) → <https://languagetool.org/> — it checks spelling *and* grammar as you browse, unlike a basic spellchecker.
 2. Open each page from the sitemap (see #8 below) with the extension on, and it will underline issues in real time.
 3. For a one-shot bulk check without installing anything: copy each blog post's body text into <https://www.grammarly.com/grammar-check> (free, no signup needed for basic checks) or <https://www.deepl.com/write>.
 4. Priority order: check the 6 recipe pages and the 3 numbered-slug blog posts (#2 above) first — older/less-visited content is where typos usually hide longest.
-

8. Sitemap & Robots.txt — Verify Directly

We weren't able to fetch `/robots.txt` and `/sitemap.xml` directly in this pass — please verify these two yourself, they take 30 seconds each and are foundational for indexing:

- **Robots.txt:** <https://www.kislaynaturals.com/robots.txt> — open it, confirm it isn't accidentally blocking `/blog/` or `/products/`.
- **Sitemap:** <https://www.kislaynaturals.com/sitemap.xml> — open it, confirm every live page/post/product is listed. Then check it's actually submitted in Search Console → **Sitemaps** report → <https://search.google.com/search-console/sitemaps>

9. Full Technical Crawl (Recommended Next Step)

For a complete site-wide check beyond this manual spot-check (broken links, image alt-text gaps, redirect chains, orphan pages, page speed per URL), run a full crawl:

TOOL	LINK	WHAT IT GIVES YOU	COST
Screaming Frog SEO Spider	https://www.screamingfrog.co.uk/seo-spider/	Full crawl: titles, metas, slugs, broken links, redirects, alt-text, in one dashboard	Free (up to 500 URLs)
Google PageSpeed Insights	https://pagespeed.web.dev/	Per-page mobile/desktop performance + Core Web Vitals	Free
Google Search Console	https://search.google.com/search-console	Indexing status, duplicate-content flags, mobile usability, sitemap health	Free
Ahrefs Webmaster Tools	https://ahrefs.com/webmaster-tools	Site Audit with 100+ automated SEO health checks	Free for verified owners
opengraph.xyz	https://www.opengraph.xyz/	Preview exactly how any URL looks when shared on social	Free

Priority Action List

Quick wins (this week):

1. Write unique title + meta description for homepage, PDP template, About, Contact, and policy pages (*Finding #1*)
2. Fix the footer copyright/legal-name inconsistency across templates (*Finding #3*)
3. Align the blog post's title tag with its H1 (*Finding #4*)
4. Add per-page `twitter:title` / `twitter:description` on blog posts (*Finding #5*)

This month:

5. Rename the 3 numbered blog slugs and set up 301 redirects (*Finding #2*)
 6. Verify robots.txt + sitemap.xml are correct and submitted in Search Console (*Finding #8*)
 7. Run a full Screaming Frog crawl + LanguageTool pass across all 17 blog posts and 6 recipe pages to catch anything this spot-check missed (*Findings #6, #7, #9*)
-

Prepared by Dr. Surbhi, Alippo — AI Co-Founder for D2C brands. This audit is based on a manual review of the homepage, one product page, About, Contact, and two blog posts as of the report date; the full-crawl tools in Section 9 are recommended to extend this coverage to every URL on the site.
